Note.- Genomic locations correspond to those of the NCBI genome (GenBank ID: NC\_04551.2). Amino acid changes are shown for nonsynonymous variants.

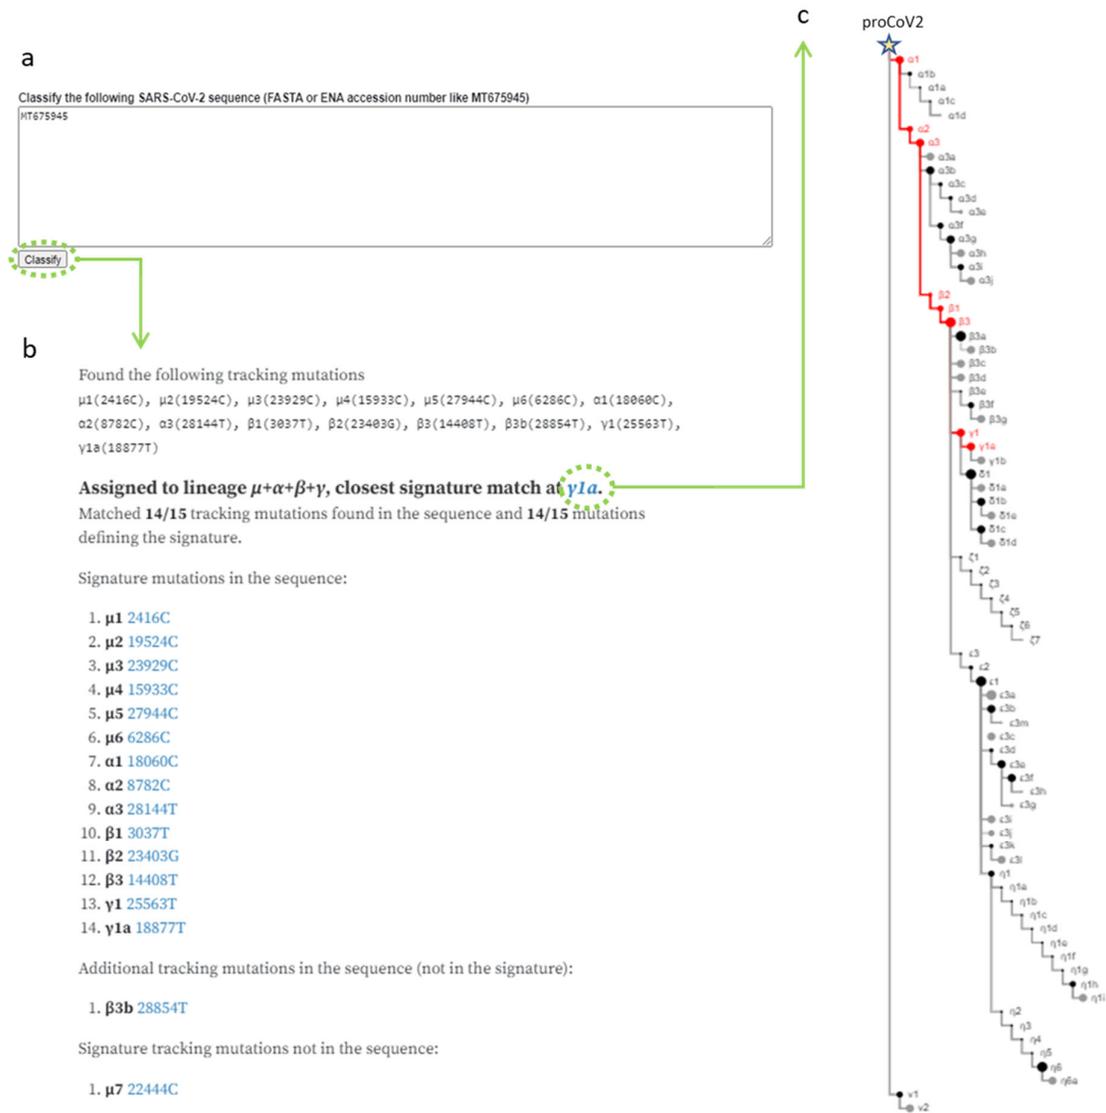

**Supplementary Figure 1.** Flowchart summarizing the procedure to generate two curated multiple sequence alignments used in this study (29KG and 68KG) from the SARS-CoV-2 genomes available in the GISAID database. Abbreviations are as follows: GISAID (Global Initiative on Sharing Avian Influenza Data [<https://www.gisaid.org>]); NCBI (National Center for Biotechnology Information [<https://www.ncbi.nlm.nih.gov>]).

**Supplementary Figure 2.** Flowchart summarizing the steps performed to construct the mutation order tree from the curated SARS-CoV-2 alignments (i.e., 29KG and 68KG). Abbreviations are as follows: GISAID (Global Initiative on Sharing Avian Influenza Data); SCITE (Single Cell Inference of Tumor Evolution); FPR (False Positive Rates); FNR (False Negative Rates); COI (Co-Occurrence Index).

**Supplementary Figure 4.** An example of sequence classification (ENA Accession MT675945) based on the 84 signature mutations (<http://sars2evo.datamonkey.org/>; “Classify your Sequence” option). (a) Input window to provide identifiers of sequences to be classified (e.g., MT675945). (b) The input sequence is classified into a mutational fingerprint. A list of mutations that are appeared in the input sequence is shown in the output window. (c) A waterfall phylogeny shows the input sequence's location in the phylogeny, which appears after clicking the closet signature matched mutation in panel b.
